REPORT OF THE HEALTH OFFICER.

GENTLEMEN: Herewith I have the honor to submit the twenty-third annual report of the health department of the District of Columbia.

From an examination of the records and files which contain the history of the year's hygienic conditions it would appear that the general public health underwent a material improvement over the year previous. The work pertaining to sanitation, inspection, and hygiene was conducted in accordance with the legal obligations and duties to the public resting upon the health officer.

Through the bureau of vital statistics the comparative progress and decline of the various diseases prevalent throughout the year have been tabulated and arranged for the use of the public and the student of hygienic science. A review also of the sociological conditions, as shown by the statistics of birth and marriage, as well as of death, will be found in the annexed tabular statements. The work of the chemical department, in relation to food and water inspection and analyses, will be found of much practical benefit, both to the public and the scientist, as will appear by an examination of the report of the chemist hereunto annexed.

The following condensed summary statements, A, B, and C, will show the aggregate results of mortality, by classes, with percentages and death rates, for the years 1893 and 1894, and population, with death rates, for nineteen years past.

STATEMENT A.—*Showing deaths by classes, arranged by sex and color, with percentages and annual death rates, for the year ended June 30, 1894.*

Causes of death.	Deaths.							Percentages to total deaths.				Annual death rate.

1894	195,000	90,000	285,000	3,329	2,710	6,039	17.07	30.10	21.16
Mean death rates.							18.48	33.30	23.41

These statements show a decrease of 413 deaths during last year, as compared with the preceding year, and 59 less deaths than in year previous to this last. This decrease took place mainly among the classes of disease which include brain, heart, and lung disorders.

While the mean annual death rate of the District for the last nineteen years is 23.41, the death rate for the last year was 21.16.

SYNOPSIS.

The work performed by the various branches of the department during the year is herewith presented in aggregate form in the annexed statements.

Table D, following, shows in detail, by months, the nuisances reported and abated during the year.

Table E furnishes the same information in consolidated form for eight years ended June 30, 1894.

FOOD INSPECTION.

Tables F and G show the amount and character of the unwholesome food inspected and condemned during the year.

The vast amount of food condemned and forced out of the market each year illustrates how important to the health and well-being of the people of this city is the food-inspection division of this department. To those who patronize the food markets an examination of these tables will be of much interest and instruction.

TABLE F.—*Unwholesome food condemned during the year ending June 30, 1894.*

MARINE PRODUCTS.

Table H exhibits the work of inspection and condemnation of the fish market. Of fish the principal kinds are shad and herring, and of shellfish, oysters and clams.

Of oysters there were inspected nearly half a million bushels. The exact number was 430,718. There were among other kinds of fish inspected 442,859 shad and 9,030,000 herring. These figures show what large proportions the fish trade of this city has assumed.

BURIAL PERMITS AND OFFICE WORK.

There were 7,025 burial permits issued for all purposes. Of these 562 were for stillbirths, 277 for transportation of dead out of the District, 147 for disinterment of bodies, and 6,039 for regular burials in the different home cemeteries. A reference to Table IX of the appendix to this report will show in detail the final disposition of the dead for the year.

At public expense there were 847 burials. During the year previous these numbered 803.

Special examinations of localities infected with typhoid fever, diphtheria, or scarlatina were made in 311 instances, upon which reports were made by the medical sanitary inspector and the proper remedies applied.

WORK OF THE CHEMICAL DEPARTMENT.

The following report of the chemist, reviewing the progress of the work in that department, will give a partial idea of the importance and dimensions thereof. His suggestion that a standard fixed by law for the quality of the milk sold in this District should receive careful attention at the hands of the lawmakers.

REPORT OF THE CHEMIST.

DEAR SIR: I submit herewith a report of the work performed in the chemical laboratory for the year ending June 30, 1894.

During the year I have made analyses of 1,420 samples, which may be classified as follows:

Milk	1,175
Cream	33
Butter	18
Vinegar	41
Colored confectionery	13
Water from public wells	23
Water from private wells	99
Miscellaneous	18
Total	1,420

Of this number 235 were submitted by private parties and the balance collected by inspectors of this office.

It will thus be seen from the above summary that the inspection of our milk supply has continued to occupy the greater share of our attention.

Of the 1,175 samples of milk examined, 317 were collected immediately on their arrival at the depots, while of the balance, 798 were collected after they had passed into the hands of the retail dealers.

While a few of the samples procured at the depots had evidently been tampered with, yet the average percentage of fat for the 317 samples was 3.38, while the 798 samples collected about the city showed only a percentage of 3.27, or a removal of nearly 20 per cent of the richness of the milk, on an average.

In addition to this, 249 of the latter-mentioned samples were below 3 per cent of fat and bore strong evidence of having been tampered with, yet we were able to secure convictions in only 33 of these cases, simply because the law provides a penalty only when something has been added to the milk, and does not take into consideration at all milk which has been deprived, either in part or in whole, of its cream. This is, in my opinion, radically wrong, for in addition to imposing a fraud upon the public, it leaves no room for honest dealers in milk to compete with those of the other class.

It thus becomes evident that in so far as the intrinsic value of this commodity is concerned, there should be a legal standard to govern the quality of the milk dispensed by the dealer.

This standard should not be too high nor too low, but should be fixed according to experience based on a knowledge of the surrounding country and the character and breed of the cattle.

From the above analyses it will be seen that the average percentage of fat for cattle of this locality is about 4, yet inasmuch as there are many instances in which good, pure, and wholesome milk fails to reach that percentage, it would be an injustice to fix the standard at that figure.

Likewise, as 3 per cent is the lowest figure that pure milk ever reaches, and that but very seldom, I should regard such a figure as placing a premium on the partial skimming of the milk, or else on the farmer keeping a poor grade of cattle and refusing to properly feed the same.

I would, therefore, respectfully recommend that a legal standard be fixed at 3.5 per cent of butter fat, 12.5 per cent of total solids, not more than 87.5 per cent of water, and not less than 8.6 per cent of solids not fat.

There will be no danger of such a standard working a hardship upon anyone, and at the same time it will prevent and put an end to the practice of removing part of the cream and selling the balance for whole milk, a custom now practiced in the District, and a custom which will continue to be practiced should the standard be fixed at lower figures than those mentioned above.

It is equally as essential that this office should have entire jurisdiction over the milk supply of this city, otherwise there can be no guaranty that the milk is pure and wholesome and free from disease germs, and in this connection it is to be hoped that the bill recently prepared by the medical society of the District of Columbia will be legalized by Congress.

Of the 122 samples of water analyzed 33 were found contaminated and unfit for use, while 5 were reported as suspicious.

Of the 41 samples of vinegar analyzed only 2 were found to meet the requirements of pure cider vinegar, most of them being made from distilled wine, diluted with water.

It was found impracticable, however, to continue this work to any extent, as there is no law governing the strength or the quality of this commodity, nor is there any limit to the amount of water that can be added to vinegar, so long as customers can be found to purchase the same.

And this applies not only to the vinegar, but also to all other articles of food, so long as the adulteration is not injurious to health.

Many of the samples of so-called butter analyzed were found to be oleomargarine, but as this department has no control over the sale of oleomargarine for butter, all that could be done was to notify the parties submitting the same of the facts as set forth by the analysis.

Of the 13 samples of candy examined, none of them were found to be colored with either mineral salts or injurious aniline colors, and I am of the opinion that the use of metallic salts for coloring candies has been practically done away with.

From the above statements it will be seen that the work of this department is seriously hampered by the lack of any definite law governing the sale of foods in the District of Columbia.

The value of the passage of such a law to the community can not be estimated.

It is not always possible to prove a thing injurious to health, even when in our own minds we know it is so, and there is but little doubt in my mind but that were such a law passed as would give to this department jurisdiction over the sale of adulterated and fraudulent articles of food it would be a great advantage to the community from a sanitary standpoint, besides being a blessing to the poor, who, while often paying for the best article of food receive an adulterated and fraudulent substitute.

Very respectfully,

J. D. HIRD,
Chemist.

The HEALTH OFFICER.

VITAL STATISTICS.

MORTALITY.

The deaths in the year amounted to 6,039, of which 3,329 were white and 2,710 were colored. For the whites the death rate was 17.07 and for the colored 30.10 per thousand of population. The death rate for the total inhabitants was 21.16, as against 22.6 for the year previous.

There were no epidemics, unless the presence of catarrhal influenza (la grippe) may be so considered. This malady still manifests its presence by yearly revisitation, and during its prevalence through the last winter and spring months caused 142 deaths, of which 95 were among whites and 47 among colored persons. Typhoid fever caused 191 deaths in localities widely scattered over the territory of the District.

ZYMOTIC DISEASES.

Owing to the increase in the mortality from epidemic influenza and typhoid fever the total deaths from this class were slightly in advance of those of last year. They numbered 1,398, as against 1,325 by the last report. There were 432 cases of diphtheria reported with 172 deaths therefrom. The percentage of mortality to cases was 39.8, and the average age of all patients was 8.7 years. There were 239 cases of scarlet fever reported, with but 14 deaths therefrom. The percentage of deaths to cases in this instance was 6.1, and the average age of patients was 7.8. This latter malady was of a mild type, as shown by the low percentage of deaths. Diarrheal diseases were the cause of 559 deaths, as compared with 575 in the year preceding.

CONSTITUTIONAL DISEASES.

From this class of diseases a mortality of 1,184 resulted, of which 675 were from consumption, while the total fatal cases from all tubercular maladies numbered 996. The maximum number of deaths from

consumption in previous years was in 1884, when they amounted to 819. Since that time there has been a gradual diminution up to the year 1894, when the least mortality from consumption occurred since 1879, when the reports in tabular form begin.

LOCAL DISEASES.

Included in this class were 2,646 deaths, divided as to race between 1,513 whites and 1,133 colored, giving a death rate of 7.76 and 12.59 respectively. There were no prominent manifestations of any particular one of this class. There appears to be still a noticeable prevalence of gastric and enteric catarrhs, which may have some connection with the epidemic influenza as sequelæ thereto.

DEVELOPMENTAL DISEASES.

These embrace those ailments incident to old age and women and children. The total number of children under 5 years old who died was 2,222, of whom 1,646 were under 1 year of age. Chargeable to the various maladies incident to birth were 606 deaths. Two hundred and ninety-one of these were infants who were victims to congenital debility and premature birth, and other disabilities attending parturition.

Of the diseases incident to womanhood 52 fatalities occurred, caused by acute lesions attending childbearing. Twenty-two cases of puerperal fever and convulsions and 15 of puerperal septicæmia composed a large percentage of this number.

One hundred and seventy-two persons died of old age, of whom 56 were between 80 and 90, and 22 were between 90 and 100.

VIOLENCE.

Deaths from violence amounted to 267, of which 211 were accidental, 11 homicides, and 41 suicides. Of the accidental deaths 18 were caused by railways, and 13 shock from laparotomy. Seventeen of the suicides shot themselves, 7 were drowned, and 5 took poison. Fourteen of the cases were foreign-born and of the balance 37 were white and but 4 colored persons.

SOCIAL RELATIONS.

MARRIAGES.

There were 1,496 returns of marriages made by the clergy of the District during the year. The attention of those authorized to perform the marriage service having been called to the legal obligation resting upon them to make returns of marriages performed by them to this Department has led to a great improvement in this respect over former years.

Not only is this obligation a legal one, but there is due also to the persons entering into the marriage relation an important duty in having a lawful record made, which in future time may become of great value to themselves or their descendants.

Of the marriages during the year 1,097 were between whites and 419 colored. As showing a tendency of our population it may be observed that only 55 out of this whole number were foreign born.

BIRTHS.

There were 5,042 births reported in the year. This is a larger number than in any previous year. The proportion of births to deaths, as thus indicated, was 83.5. According to the prevailing rule in this country the births should exceed the deaths in number. It will be seen, therefore, that many persons who preside at the birth of children in the District neglect the duty imposed upon them by law in omitting to make prompt returns to the Health Department. Besides, in this omission they perform an act of injustice to their patrons and to the children born through their assistance.

Of the births, 2,655 were attended by physicians and 2,387 by midwives. The illegitimate births increased from 578 in the preceding year to 616 in the present one, of which 77 were white and 539 colored.

STILLBIRTHS.

It is a matter of regret to notice an increase of over 15 per cent in the number of stillbirths as compared with last year. As against 475 then they now amount to 562. Out of the whole number but 51 were illegitimate, and 240 came to the ninth month of utero-gestation. There was one report of a tenth month and one of an eleventh month of pregnancy. About two-thirds of the cases were reported by physicians alone.

RECORDS.

The records of vital statistics were posted up to the close of the year. At that date there were recorded 97,055 names of deceased persons buried within the limits of the city, 77,396 birth returns, and names of 39,538 persons who contracted marriage. These records are all in good business shape, while the numerous applications daily for transcripts therefrom attest their great value to the needs of the public. As time progresses they will appreciate in importance, since there is no other full set of records of death, birth, and marriage in the District of Columbia.

CONCLUSION.

Tabular statements from I to XLVII and the usual maps, showing the location of deaths and number by squares, drawn up to illustrate the foregoing text, and to accompany them, will be furnished when required for publication.

Very respectfully,

C. M. HAMMETT, M. D.,
Health Officer, District of Columbia.

THE COMMISSIONERS OF THE DISTRICT OF COLUMBIA.
